## Fixed drug eruption to tartrazine.

Orchard DC<sup>1</sup>, Varigos GA.

### Author information

#### Abstract

An 11-year-old girl with a recurrent fixed drug eruption to tartrazine on the dorsum of the left hand is presented. Oral provocation tests to both the suspected food, an artificially coloured cheese crisp, and to tartrazine were positive. This case highlights the need to consider artificial flavours, colours and preservatives as potential culprits in classic drug eruptions.
